# Lower Duchesne Wetlands Project Questions & Answers

## AGRICULTURAL AND SOCIOECONOMICS

#### Q: How will private property acquisition affect local property tax revenues?

- A: Private lands acquired on a willing-seller basis for the LDWP will be retained in "fee status" under Tribal corporate ownership, thereby retaining those private lands on the local tax rolls and minimizing tax revenue losses.
  - Changes in tax revenues associated with acquiring residences and converting from residential to greenbelt use, will result in total tax losses to Duchesne and Uintah counties, ranging from \$0 to \$1,632 annually.

# Q: What effects will the LDWP have on the livestock industry and agricultural production and practices?

A: LDWP will affect agricultural practices and operations in the project area as follows:

- 58 acres of cropland will be withdrawn from agricultural markets and, instead, devoted to sustaining wildlife. (Marketable yield on 58 acres of cropland would be about 232 tons per year of grass and alfalfa hay.) The loss of 232 tons of crop production represents a 0.1 percent decrease in the two-county area.
  - ° The 58 acres of cropland within project boundaries will be acquired in fee.
  - ° There will be no conservation easements purchased on established cropland.
- Grazing will be eliminated from pastures within the project area, unless necessary to achieve wildlife management goals.

### Q: Have you revised your economic impact analysis from the Draft EIS?

**A:** Yes. A revised economic impact analysis was prepared for the Project's Final EIS. The new model, referred to as IMPLAN, is used by the State of Utah and other federal agencies for economic impact forecasting.

- The IMPLAN model uses a multiplier that captures the widest possible economic impacts on the regional economy.
- According to the revised analysis, the Project will result in the following temporary increases to the local economy during its construction:
  - ° net economic output: \$924,729 to \$1,259,642
  - ° personal earnings: \$316,387 to \$375,305
  - ° employment: 13.1 to 15.1 jobs
- After construction, project operation should increase the net economic output by \$335,810 annually.
- None of the changes in output represent more than a 0.1 percent change in the Uinta Basin economy.
